Analytica 2008 – Begerow Depth filtration – innovative systems from laboratory to production scale

BEGEROW offers an ideal concept for facilitating laboratory and pilote plant trials and transferring the results with the same depth filter medium to the production scale.

The scale-up range includes miniature BECO MiniCap disposable filtration units, 2.5", 10", and 30" BECOCAP depth filter capsules and BECODISC stacked disc cartridges.

BECO MiniCap and BECOCAP depth filter capsules are ideal filtration units for fast and reliable selection and configuration of the appropriate process filter. They can also be used for the filtration of smaller production volumes.

The benefits of using disposable filters are simple handling, shorter process times, and higher process reliability due to the fact that cleaning and cleaning validation are no longer required. Both capsule types are immediately ready for use, offering a high degree of flexibility. No additional housing is required. The capsule design and connection options prevent direct contact between user and product to be filtered.

These depth filter capsules cover a wide range of application options in biopharmaceutical up- and downstream processes, scale-up and feasibility studies, and protection of downstream membrane filters.

In Hall B1, Booth 441, our specialists are available for shoptalk in a pleasant atmosphere.
