**Begerow Presents World Innovation.**

Under the motto 'The truth must come to light', Begerow raises the curtain for a world innovation in the filtration market.

BECOPAD was presented to the world for the first time at the 7th Filtration Event in Bingen, Germany.

This product name describes the first mineral-free depth filter medium that is suitable for all types of filtration, ranging from coarse to sterile. The filter medium consists of special celluloses that are optimized using the *bepure* process, a special technology developed by Begerow.

This organic medium revolutionizes liquid filtration and promises unexcelled purity.

According to company sources, Becopad will initially be offered in seven filtration ranges for the beer market. All formats are possible. Depending on the application requirements, high cationic versions of these media with identical filtration rates are also available. They differ only with regard to the adsorption capacity.

Becopad stands for freedom from heavy metals, 20% higher performance, 50% lower flushing volume, significantly reduced backwashing volume, 99% reduction of drip losses, 99% reduction of mold risk, and 100% biodegradability.

It sets new standards through maximum microbiological safety and unsurpassed exterior hygiene and the fact that the product remains unaffected. The stability of BECOPAD is similar to the wet bursting strength of conventional depth filter media, while steam resistance is significantly higher.

After many years of testing in the laboratory and at production scale, users are now offered a new filter medium that is technologically matured.

Becopad from Begerow sets a new standard in the field of depth filtration of liquids. According to company sources, this premium product is unlike any other depth filter medium.
